

AMT Floating License Server Setup

This document will explain how to setup a computer as a floating license server for AMT Software applications.

After installation of the floating license server software, a program group name AMT Floating License Server is created. Start the program Floating License Server from this program group:

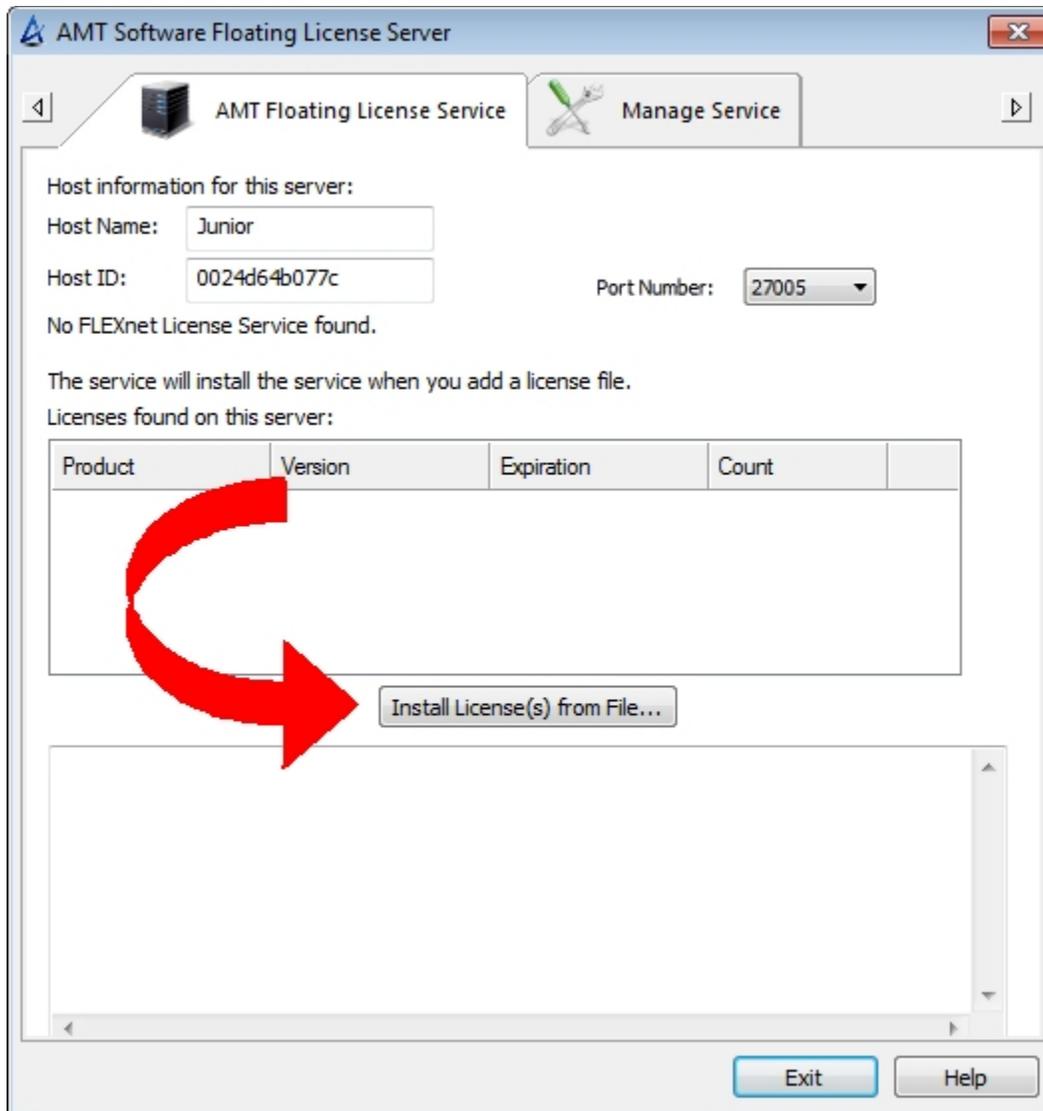

You must login as Administrator or have administrative privileges to run the program.

AMT Software will require the Host Name and Host ID shown in the application. You can use Copy (Ctrl+C) to copy this information to easily paste it into an e-mail you will send to amt-support@amt-software.com requesting a license file. Please include in your e-mail the contact information in case our support staff needs to contact you for more information.

A license file will be sent to you via e-mail as an attachment. When you receive the file (*.lic extension), save it to disk. Start the Floating License Server program again then click on Install License(s) from File....

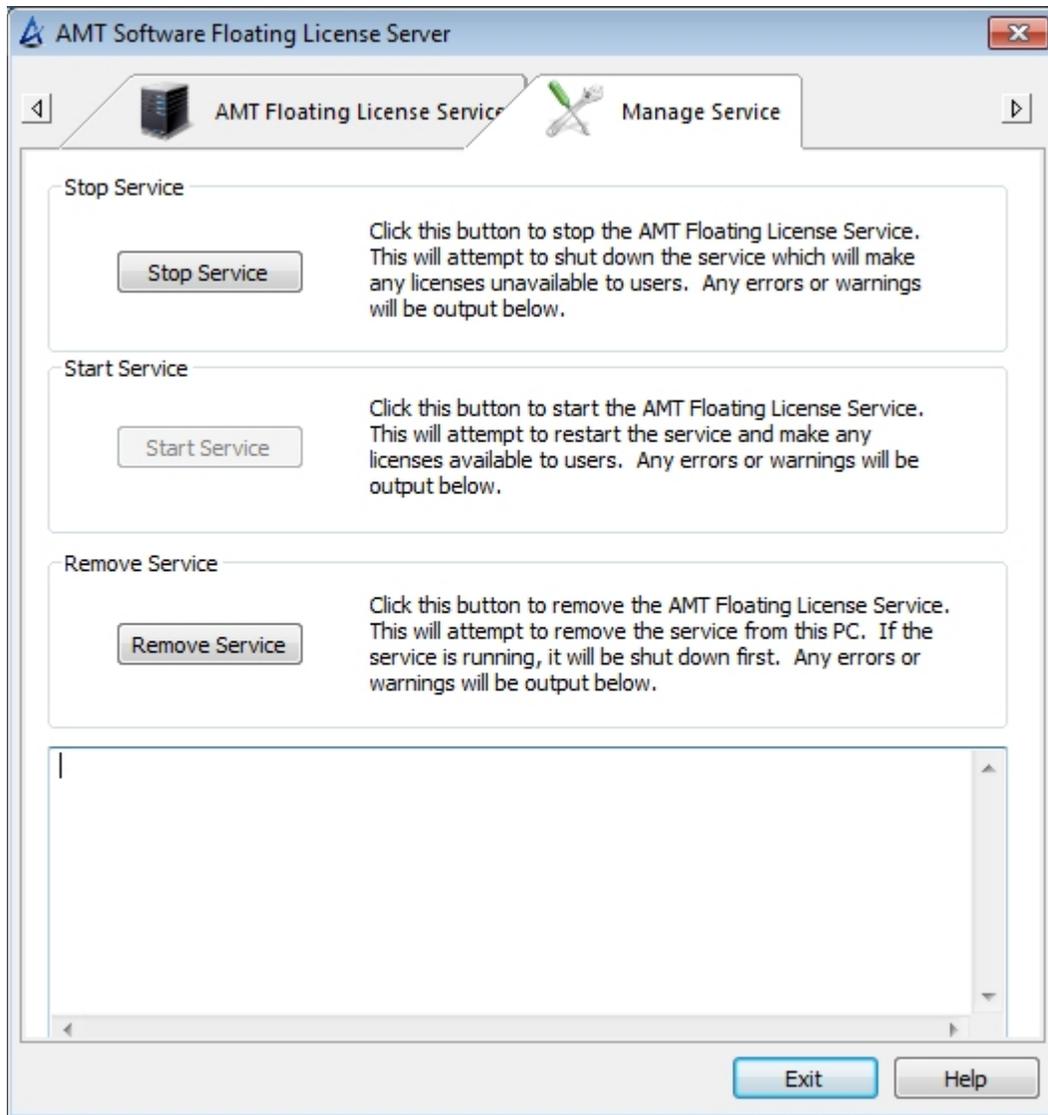

Browse for the license file and click on Open.

The program will configure the computer with the proper services to be a floating license server. Be patient. This may take up to a minute to configure your computer.

On completion the license(s) you purchased will be available as floating licenses served up by this computer.

If you are setting up redundant servers, make sure you use the same port number for each server.

Managing Services

The Manage Service tab of the application allows you to:

Stop Service - stop the service that manages the distribution of software licenses over the network.

Start Service - start the service to manage floating licenses.

Remove Service - removes the service from the Windows service manager.

The log message area will report the success or failure of the operation you choose to perform.

Problems?

Note that a log is produced in the message area of the dialog. If there is a problem with the license installation process, the problem or issue will be reported here. Copy and paste the logging information to send to amt-support@amt-software.com for assistance in debugging problematic license installation.

In addition to the logging information in the dialog, a log file "AMT Software LicenseServer.log" is created in your temp directory. You can e-mail this log file to amt-support@amt-software.com so our technicians can debug the problem(s):
